CONSIDER APPROVAL OF A NON-EXCLUSIVE ROTARY DRILLING GEOLOGICAL SURVEY PERMIT ON SOVEREIGN TIDE AND SUBMERGED LANDS

APPLICANT:

Calleguas Municipal Water District Attn.: Ms. Kristine McCaffrey 2100 Olsen Road Thousand Oaks, CA 91360-6800

BACKGROUND:

The geological surveys authorized under the terms of the permit are for the purpose of obtaining core samples of the seafloor for geotechnical information. Geological and geotechnical samples of the subsurface sediments will be collected at six locations (shown on Exhibit A, attached hereto). The analysis of the samples will be used to evaluate the proposed location and to design a brine water outfall pipeline. The outfall will discharge waste brine solution generated from groundwater desalination facilities, and other treated effluent from various treatment facilities within the Calleguas Creek watershed. The shallow geologic samples (90 feet deep) will be obtained using closed system rotary drilling techniques from a self-contained vessel.

Each boring is anticipated to take about 12 hours to complete. Closed system drilling from a self-contained drill ship will be conducted within a 6-inch diameter casing, which will extend from about 20 feet below the ocean floor to the ocean surface. Drilling fluid will be circulated through the drill pipe and casing to tanks on the drill ship. Use of less than 100 pounds of 100 percent (100%) biodegradable bentonite drilling mud per boring is anticipated for the entire project. The mud and soil spoils system is fully contained and no fluid or soil cuttings will be discharged into the ocean as part of the drilling process. Upon completion of the project, the soil cuttings and drilling fluid will be disposed of onshore at an appropriate disposal facility. A Spill Contingency Plan and Drilling Fluid Monitoring Plan have been provided. Upon request, the California State
